Customer Reviews

Hi,I have written a detailed chapter-by-chapter review of this book on www.DOT-i-programmer.DOT-info, the first and last parts of this review are given here. For my review of all chapters, search www.DOT-i-programmer.DOT-info for STIRK together with the book's title. With regular breaching of websites/data in the news (e.g. eBay, Three, VTech), this book should be of interest to many. This book aims to show you what information can be found via Google search queries, much of it never intended for a public audience (e.g. credit card numbers, passwords). The book is targeted at those wanting to protect their sites/data, those wanting to get more out of Google search queries, hackers, and the curious. Some of the tools are introduced with little discussion, so some degree of IT-awareness is required. Also a few areas require scripting knowledge (typically using perl). Below is a chapter-by-chapter exploration of the topics covered.

Chapter 1 Google Search Basics

The chapter opens with a look at Google's deceptively simple interface, being void of clutter and having a single place to enter search criteria. Various related screens are examined, including image search, groups, preferences, language tools, and the results page. The chapter continues with a look at rules for Google searching, including the use of wildcard characters, and the 32-word search limit. The use of quote marks for exact phrase searching, and Boolean operators for joining/omitting results is discussed with examples. Getting more targeted search results by search reduction is examined. The chapter ends with a look at the format of the Google URL for submitted queries, where search parameters and their values are separated by an ampersand.
