What Your Doctor May Not Tell You About Menopause

Synopsis

Women considering hormone replacement therapy (HRT) for menopause symptoms and health benefits should listen to this controversial, provocative audiobook first. "Advertising and research dollars are spent trying to convince women that estrogen will cure everything from heart disease to Alzheimer's," writes John R. Lee, MD, "but there is scant evidence for any of these claims and reams of evidence that synthetic estrogens are highly toxic and carcinogenic." Lee has studied the research and concludes that estrogen is not the magic bullet for protection against heart disease and osteoporosis, nor does it retard aging. Natural progesterone, instead, puts postmenopausal women's hormones in balance, says Lee. He cites study after study that indicates that natural progesterone, obtained in cream form, delivers what the usual HRT only promises. "Menopause as a disease has been largely fabricated by physicians and the pharmaceutical industry," says this leader of a "quiet but powerful revolution" regarding HRT. *What Your Doctor May Not Tell You About Menopause* covers the benefits of natural progesterone, the history and politics of the medical and drug establishment, the biochemistry and dynamics of hormones and how they get out of balance, and how to prevent hormone imbalance and stay healthy. Lee empowers you to ask hard questions of your doctor.

Book Information

Audible Audio Edition

Listening Length: 13 hours and 36 minutes

Program Type: Audiobook

Version: Unabridged

Publisher: Recorded Books

Audible.com Release Date: October 23, 2015

Language: English

ASIN: B01708FC8Y

Best Sellers Rank: #20 in Books > Health, Fitness & Dieting > Women's Health > Menopause

#234 in Books > Audible Audiobooks > Health, Mind & Body > Health #274 in Books >

Engineering & Transportation > Engineering > Bioengineering > Biochemistry

Customer Reviews

The author, a medical doctor with 30 years of private practice experience, decided that he wasn't being very effective in helping his women patients deal with unpleasant premenopausal and menopausal symptoms. He began to research the research on hormone balance, HRT (hormone

replacement therapy), and the way the medical and pharmaceutical industries deal with the "disease" of menopause and "female problems." What he discovered was that treating menopause as an "estrogen deficiency disease" was exactly wrong. In fact he argues that premenopausal and menopausal women are much more likely to be in a state of "estrogen excess" relative to levels of progesterone, which are often close to zero. Estrogen excess leads to weight gain, mood disorders, endometriosis, low sex drive, fibrocystic breasts, heart disease, and osteoporosis. Yet what the most doctors and drug companies offer to do is to increase estrogen levels with synthetic hormones made with pregnant mare's urine and synthetic progestins. While this may temporarily relieve certain symptoms like vaginal dryness and hot flashes, this HRT regime ultimately leads to worse side effects, including increased breast cancer risk, increased bone loss, increased overall cancer risk, and increased heart disease risk. Yet we are told that HRT is the only way to prevent osteoporosis and heart disease! John Lee explodes these myths and many more, including that any woman needs a hysterectomy unless she has cancer (yet over 600,000 are done in the US each year, meaning 600,000 potential new consumers of HRT!!) Over the years he has helped thousands of women restore their hormone balance and their lives with diet, exercise, and the use of natural progesterone (usually applied topically in a cream).

In eight years I became "hot natured," gained 20 pounds, began to search for words and for the most part walked around in a fog. Chores I once accomplished with ease required great effort and I became impatient when I could not find things. Even more disabling—my occasional headaches increased to up to thirteen a month and became migraines. Since I'd just turned 51 a friend suggested it might be hormones and recommended I get a hormone saliva test. While I was waiting for the test results another friend gave me some progesterone cream. The results were almost immediate. The frequency and intensity of the migraines decreased, my mental fog lifted, I felt more relaxed and I had more energy. In short—I was my old self again. My hormone saliva test confirmed my suspicions—my estrogen and testosterone levels were normal but my progesterone level was near zero. That's when I found Dr. John R. Lee's book "What Your Doctor May Not Tell You about Menopause." I was shocked to learn that most menopausal women of western industrial countries have estrogen dominance (they've become deficient in progesterone) because they've been exposed to more estrogen substances in their meat, detergents, pesticides, herbicides, auto pollution and plastic household utensils. The combination of environmental pollutants, lack of exercise, cultural attitude and a diet rich in animal fat, sugar, refined starches and processed food leads to Western women's estrogen levels to be twice as high as women in the Far East and in

third-world-countries whose passage through menopause is mostly symptom free. To correct the progesterone deficiency Dr. Lee recommends natural progesterone made from Mexican wild yams or soy products as they can easily be used and eliminated by the body and have no known side effects.

This book opened my eyes to the bias that American doctors have against using natural progesterone, and the authors taught me almost everything I now know about this subject; however, they left out one extremely important point. When a patient needs progesterone, her hormone levels must be professionally tested by using a revolutionary new type of blood test or salivary test. Then, their doctor can prescribe the correct amount of natural progesterone to use and also proceed to monitor her blood levels. Hormones are very powerful and should be used under the guidance of a medical doctor who is familiar with the proper protocol. Over the counter creams can be a quick fix, but they are presently unregulated. Would you prescribe a band-aid for someone who really needs stitches in order to heal their wound? The answer, of course, is, "No!". Yet, Dr. Lee and Virginia Hopkins neglect to mention anything about the necessity of being tested and having your hormone levels monitored by a trained professional. As the above authors state, most women in the United states are oblivious to the importance of maintaining the correct level of progesterone all the way through their premenopausal, perimenopausal and menopausal cycles. However, for some reason Dr. Lee ignores the following extremely pertinent information: "The revolutionary discovery of radioimmunoassay blood tests changed the method of measuring female hormones, because blood samples could be used with greater accuracy. To the surprise of PMS workers, this method showed that low progesterone blood levels were not necessarily associated with PMS." (Dalton, Katharina, M.D.: "Once a Month", Publishers group West, 1700 Fourth Street, Berkley, CA, 94710. Copyright 1999, p.
